Ben Salisbury* (ben.salisbury@cmich.edu), Department of Mathematics, Central Michigan University, Pearce Hall 206H, Mount Pleasant, MI 48859, and **Travis Scrimshaw** (tscrim@ucdavis.edu), Department of Mathematics, University of California, One Shields Avenue, Davis, CA 95616-8633. *A rigged configuration model for $B(\infty)$.*

The crystal $B(\infty)$ is a combinatorial skeleton of the negative half of the quantum group, and its importance in the theory of crystal bases has been highlighted since Kashiwara's original papers on the subject. Since then, many combinatorial models for $B(\infty)$ have been developed (i.e., tableaux, MV polytopes, quiver varieties, Nakajima monomials, etc). In this talk, we introduce yet another model for $B(\infty)$; one that is somewhat uniform across all symmetrizable types. (Received November 19, 2014)
