Ben Li* (bx1292@case.edu), 12000 Fairhill Road. Apt 710, Cleveland, OH 44120, and **Elisabeth Werner**. *Affine invariant points for functions*.

Gruenbaum introduced affine invariant points and mappings for convex bodies and Meyer Schuett and Werner carried out an extensive study of these notions.

We introduce them for log-concave and s-concave functions. We give new examples of affine invariant points and mappings for functions, e.g., the John function, the Loewner function and the floating function. (Received February 23, 2016)
