Chong Wang* (chongwang@gwu.edu), 532 20TH ST NW, Apt 705, Washington, DC 20006, and **Yanxiang Zhao** and **Xiaofeng Ren**. *Pattern Formation – on the modeling of multi-constituent inhibitory systems*.

Skin pigmentation, animal coats and block copolymers, which can be considered as multi-constituent inhibitory systems, are all around us. Theoretical analysis and numerical simulation of multi-constituent inhibitory systems will be provided here. An inhibitory system is studied as a nonlocal geometric variational problem. The free energy of the system is the sum of two terms: the total size of the interfaces separating the constituents, and a longer ranging interaction energy that inhibits micro-domains from unlimited growth. We establish that in different parameter ranges there are corresponding assemblies of certain patterns that exist as the stationary sets of the free energy functional. Numerically, a diffusive interface model is proposed here to study the dynamics. To reduce the computational complexity, a reduced FFT-based fast algorithm is also discussed here.
